

Mit openrouteservice ganze Länder vermeiden für die Routenplanung

- Gegründet ca. ~ '08 und mittlerweile Teil des Heidelberg Institute for Geoinformation Technology (HeiGIT)
- ORS bietet eine freie API mit folgenden Services: Routing | Geocoding | Isochrones | Matrix
- Vollständig basierend auf freien und offenen Datenquellen

Live Präsentation

Beispiel 1: Isochronen und Bevölkerungsdaten

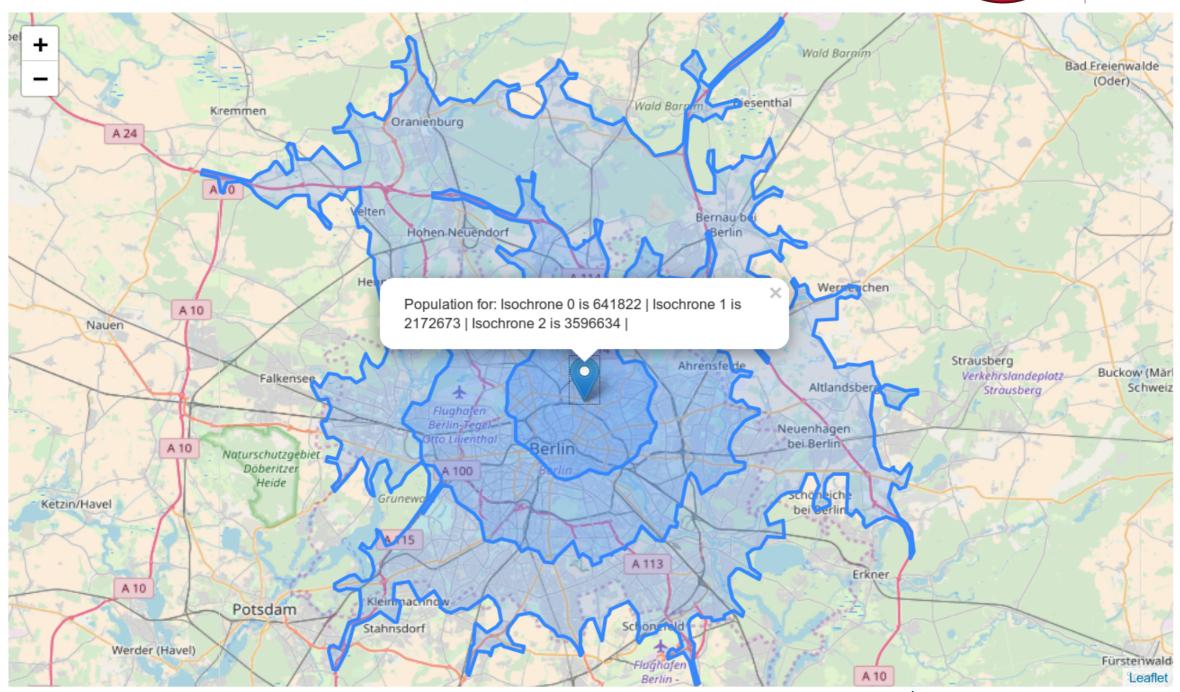

```
# Imports and service connect
   import folium
   import openrouteservice as ors
   from openrouteservice.isochrones import isochrones
   client = ors.Client(key='YOUR KEY')
   lat = 52.549636 # Berlin
   lon = 13.425293 # Berlin
   # ORS-Isochrones with statistics
   isochrone geojson = isochrones(client, (lon, lat), intervals=[600, 1200, 1800],
13
                                  attributes={'total pop'}, profile='driving-car')
   # Extract population data
   pop string = 'Population for: '
   for x in range(0, len(isochrone geojson['features'])):
       total_pop = (isochrone_geojson['features'][x]['properties']['total_pop'])
18
       pop string += 'Isochrone {} is {} | '.format(x, total pop)
19
20
21 # Folium map with marker
   map osm = folium.Map(location=[lat, lon]) # Folium map
folium.GeoJson(isochrone geojson).add to(map osm) # Add data to map
   folium.Marker([lat, lon], popup=pop string).add to(map osm) # Add marker to map
```

Beispiel 2: Grenzen vermeiden. Von Freiburg nach Mailand

```
## Imports
from openrouteservice.directions import directions

## Route Nr.1: Normal
coords1 = 7.842865, 47.996355 # Freiburg
coords2 = 9.228516, 45.47554 # Mailand

route1 = directions(client, ((coords1), (coords2)), format_out='geojson', profile='driving-hgv') # ORS

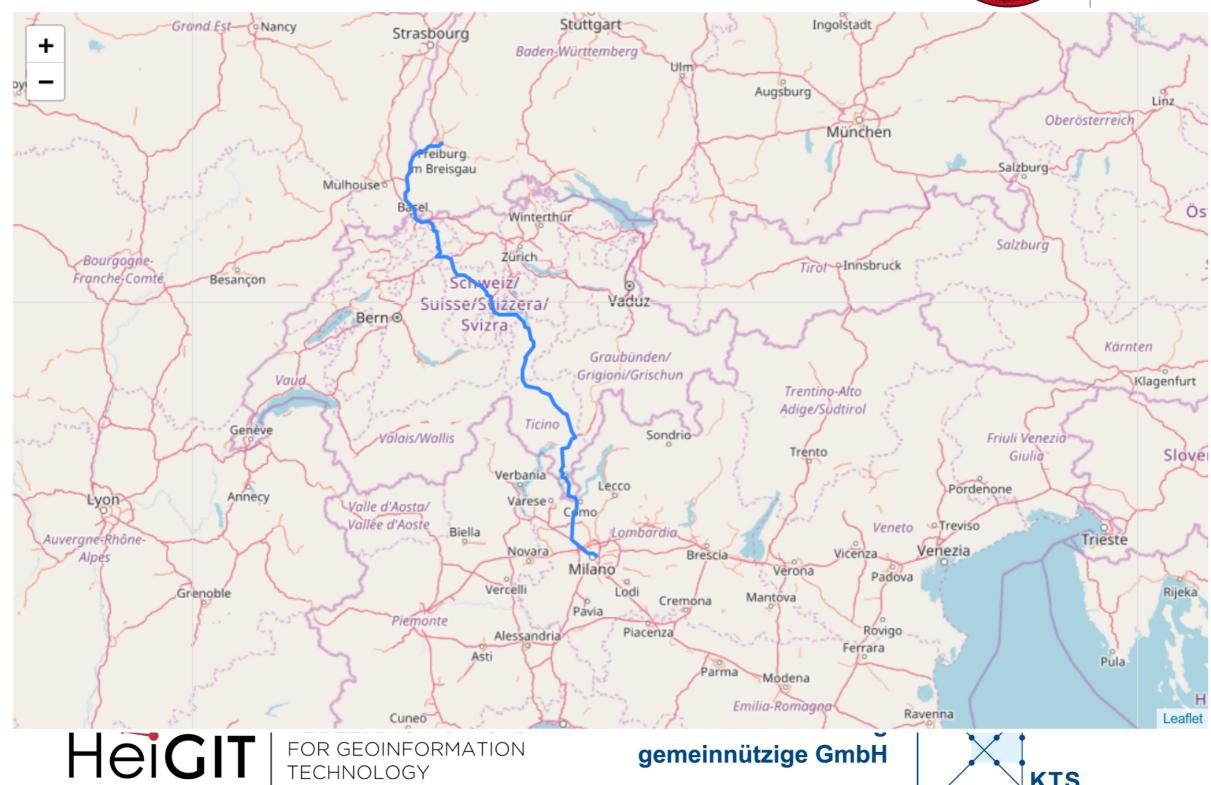

map_osm = folium.Map(location=[46.626335, 9.360867], zoom_start=7) # Folium Map
folium.GeoJson(route1).add_to(map_osm) # Add to map
```

Beispiel 3: Routenplanung am Beispiel der Seidenstraße. Von Kairo nach Hangzhou

```
for x in range(0, len(coords)-1):
    coordinates = ((coords[x][1], coords[x][0]), (coords[x+1][1], coords[x+1][0])) # Coordinates
    geojson = directions(client, coordinates, format_out='geojson') # ORS
```
